COOLANT

Drain and refill

Draining

WARNING: Do not remove the expansion tank filler cap when the engine is hot because the cooling system is Pressurized and personal scalding could result.

1. Remove the expansion tank filler cap by first turning it counter-clockwise a quarter of a turn to allow pressure to escape, then turn it further in the same direction and lift off.

2. Remove the radiator filler plug and washer to assist drainage.

3. Disconnect the radiator bottom hose and allow the coolant to drain into a suitable container. Use a clean container if the coolant solution is to be reused. Reconnect the bottom hose after draining and tighten the hose clamp.

4. Remove the engine drain plugs, one each side of the cylinder block, beneath the exhaust manifolds. Allow the coolant to drain and refit the plugs.

See the following coolant requirements before refilling the system.

Continued
Coolant requirements

Frost precautions and engine protection.

The engine cooling system MUST ALWAYS be filled and topped-up with a solution of water and anti-freeze, winter and summer. NEVER use water alone as this may corrode the aluminium alloy.

CAUTION: Do not use salt water otherwise corrosion will occur. In certain territories where the only available natural water supply has some salt content use only rain or distilled water.

Recommended solutions

Anti-freeze: Universal anti-freeze or permanent type ethylene base, without methanol, containing a suitable inhibitor for aluminium engines and engine parts.

Use one part of anti-freeze to one part of water.

Anti-freeze can remain in the cooling system and will provide adequate protection for two years provided that the specific gravity of the coolant is checked before the onset of the second winter and topped-up with new anti-freeze as required.

Vehicles leaving the factory have the cooling system filled with 50% anti-freeze and 50% water mixture. This gives protection against frost down to minus 36°C (minus 33°F). Vehicles so filled can be identified by a label affixed to the radiator.

NOTE: Should ambient temperatures be below that stated above refer to Anti-Freeze Data in Recommended Lubricants, Fluids and Capacities in Section OS. Instructions in the chart must be strictly adhered to before driving the vehicle away.

After the second winter the system should be drained and thoroughly flushed. Before adding new anti-freeze examine all joints and replace defective hoses to make sure that the system is leakproof.

See the ‘Recommended Lubricants Fluids and Capacities’, Section 09, for protection quantities.

Refilling

5. Pour 4.5 litre (1 gal) of water into the radiator.
6. Add the recommended quantity of anti-freeze.
7. Top-up the radiator with water, refit the radiator filler plug and washer and tighten.
8. Add water to the expansion tank, up to the ‘WATER LEVEL’ plate.

NOTE: The water level plate on later models has been deleted from the expansion tank, therefore the coolant should be filled to the top of the sensor float which is approximately 1.00 inch (25 mm) below the filler neck.
9. Fit the expansion tank filler cap.
10. Run the engine until normal operating temperature is attained, that is, thermostat open.
11. Allow the engine to cool, then check the coolant level and top-up if necessary.
EXPANSION TANK

Remove and refit

Removing

WARNING: Do not remove the expansion tank filler cap when the engine is hot because the cooling system is pressurized and personal scalding could result.

1. Remove the expansion tank filler cap by first turning it counter-clockwise a quarter of a turn to allow pressure to escape, then turn it further in the same direction and lift off.
2. Disconnect the hose to the radiator.
3. Disconnect the multi-plug to the coolant level sensor.
4. Remove the pinch bolt.
5. Lift out the expansion tank.

Refitting

6. Reverse 1 to 5.
7. Replenish the cooling system.
8. Check for leaks around all hose connections.

COOLANT LEVEL SENSOR

Remove and refit

Removing

WARNING: Do not remove the expansion tank filler cap when the engine is hot because the cooling system is pressurized and personal scalding could result.

1. Disconnect the multi-plug from the sensor.
2. Remove the expansion tank filler cap by first turning it counter-clockwise a quarter of a turn to allow pressure to escape, then turn it further in the same direction and lift off.
3. Release the retaining nut and withdraw the sensor from the expansion tank.

1. Disconnect the multi-plug from the sensor.
2. Remove the expansion tank filler cap by first turning it counter-clockwise a quarter of a turn to allow pressure to escape, then turn it further in the same direction and lift off.
3. Release the retaining nut and withdraw the sensor from the expansion tank.
4. Reverse the removal instructions.
5. Start engine and run until normal running temperature is attained, thermostat open, check for coolant leaks around the sensor.
**FAN BELT**

Check and adjust tension, 1 and 5 to 6

Remove and refit, 1 to 6

Removing

**WARNING:** Disconnect the battery negative terminal to prevent the engine being started before removing or adjusting drive belts.

1. Loosen the idler pulley pivot bolt.
2. Pivot the idler pulley inwards.
3. Lift off the fan belt.

Refitting

4. Locate the fan belt on the pulleys.
5. Adjust the fan belt using the idler pulley to give 4 to 6 mm (0.19 to 0.25 in) free movement when checked midway between the fan and crankshaft pulleys by hand.
6. Tighten the idler pulley pivot bolt and check the adjustment.

**NOTE:** Re-check the belt adjustment after approximately 1500 km (1,000 miles) running when a new belt has been fitted.

**VISCOSOUS COUPLING, FAN BLADES, PULLEY AND FAN COWL**

Viscous coupling—remove and refit 1 to 5

Fan blades—remove and refit 1 to 5 and 8

Fan cowl—remove and refit 1 to 4

Fan pulley—remove and refit 1 to 7

Removing

**WARNING:** Disconnect the battery negative terminal to prevent the engine being started before removing or adjusting drive belts.

1. Loosen the nut securing the viscous coupling and fan blade assembly to the water pump shaft.

**NOTE:** The nut securing the viscous unit to the water pump has a left hand thread, to release the nut, turn in a clockwise direction when viewed from the front of the viscous unit.

2. Remove the four fan cowl fixings and lift the cowl out of its lower mountings.

3. Remove the viscous coupling securing nut and withdraw the assembly.
4. Remove the fan cowl, if necessary.
5. Remove the fan blades from the viscous coupling, if necessary.
6. Remove the fan belt and, if fitted, the compressor belt.
7. Remove the pulley fixings and withdraw the pulley.
RADIATOR

Remove and refit

Removing

1. Drain the cooling system.
2. Remove the fan blades.
3. Remove the fan cowl.
4. Disconnect the top hose from the radiator.
5. Disconnect the hose to the expansion tank at the radiator.

Refitting

6. Disconnect the hose to the thermostat elbow at the intake manifold.
7. Remove the fixings from each side of the radiator.
8. Withdraw the radiator by lifting from its locations. Check the condition of the rubber mounting pads.

Refitting

9. Reverse 1 to 8 noting the assembly order of the radiator side fixings and ensuring that the radiator sealing strips are correctly located and secure.
10. Check for coolant leaks around all hose connections.

REVISED: JULY 88
THERMOSTAT
Remove and refit

Test

Removing

1. Partially drain the cooling system, until coolant level is below thermostat housing.
2. Disconnect the hose from the thermostat housing.
3. Disconnect the electrical connections to the water temperature switch.
4. Remove the outlet elbow.
5. Withdraw the thermostat.

Testing

6. Note that the rating of the thermostat is 88°C (190°F). Place the thermostat in a suitable container half full of water. Heat the water and observe the temperature at which the thermostat opens. Should the thermostat open between 85°C (185°F) and 89°C (192°F) the unit is operating satisfactorily.

Refitting

7. Insert the thermostat with the jiggle pin/vent hole uppermost (12 o'clock position).
8. Using a new joint washer, fit the outlet elbow and tighten to the correct torque, see Torque values-Section 06.
9. Reverse 1 to 3.
10. Check for coolant leaks around all hose connections and joint faces.
WATER PUMP

Remove and refit

Removing

WARNING: Disconnect the battery negative terminal to prevent the engine being started before removing or adjusting drive belts.

1. Drain the engine cooling system.
2. Remove the fan belt, power steering pump and compressor belt.
3. Remove the fan blades and pulley.
4. Disconnect the inlet hose from the water pump.
5. Release the alternator adjusting link and the power steering pump fixings.
6. Remove the remaining water pump bolts.
7. Remove the water pump and joint washer.

8. Lightly grease a new joint washer and place it in position on the timing cover.

9. Clean the threads of the four long bolts and coat with Loctite 572 thread lubricant-sealant.
10. Locate the water pump in position.
11. Locate the alternator adjusting link and power steering pump bracket.
12. Leave the alternator adjusting link loose and tighten the remaining water pump housing bolts evenly and to the correct torque, see Torque values-Section 06.
13. Connect the inlet hose to the water pump.
14. Fit the fan pulley.
15. Fit and adjust the fan belt, power steering pump belt and compressor belt.
16. Fit the fan blade assembly.
17. Refill the cooling system.
18. Check for coolant leaks around all hose connections and joint faces.

COOLING SYSTEM • 1989 model year.

The 3.9 litre engine has a revised 'partial flow' type cooling system. A new radiator incorporates oil coolers in both end tanks - left hand side, transmission oil cooler - right hand side, engine oil cooler.

A supplementary transmission oil cooler is still fitted in front of the radiator and condenser fans. The transmission oil high temperature warning light sensor is now fitted under the hood adjacent to the radiator end tank.

COOLANT

Drain and refill

Draining

WARNING: Do not remove the expansion tank filler cap when the engine is hot, because the cooling system is pressurised and personal scalding could result.

1. Remove the expansion tank filler cap by first turning it counter-clockwise a quarter of a turn to allow pressure to escape, turn it further in the same direction and lift off.

2. Remove the radiator filler plug and 'O' ring to assist drainage.

3. Disconnect the bottom hose at its junction with the radiator and allow the coolant to drain into a suitable container. Ensure that the container is clean if the coolant solution is to be re-used. Reconnect the bottom hose after draining and re-tighten the hose clamp.

4. Remove the engine drain plugs, one each side of the cylinder block, beneath the exhaust manifolds. Allow the coolant to drain, refit and tighten the plugs.

Continued
NOTE: It is not possible to drain all the coolant retained in the heater system. Flush through the system, after draining, by pouring clean water into the fill tower, (see RR2659E), with the bottom hose disconnected and engine drain plugs removed.

5. Pour the correct solution of water and anti-freeze into the expansion tank until the radiator is full.
6. Start the engine and run it until normal operating temperature is attained, topping up as necessary.
7. Refit the radiator filler plug and 'O' ring, fitting a new 'O' ring if required. Tighten to the correct torque, see Torque Values, section 06.
8. Fit the expansion tank filler cap.
9. Allow the engine to cool, check coolant level and top up the expansion tank until the level reaches the level indicator on the inside of the tank.

CAUTION: The following fill procedure MUST be followed if the heater pipes mounted on top of the rocker cover have been removed for any reason.

RADIATOR/OIL COOLERS

Remove and refit

Removing

1. Drain the cooling system.
2. Remove the fan blade assembly.
3. Remove the fan cowl.
4. Disconnect the radiator top hoses.
5. Disconnect the four transmission and engine oil cooler connections to the radiator and tanks. Note that oil spillage will occur when connections are loosened. Blank off exposed oil connections.
6. Disconnect the transmission oil temperature sensor plug.
7. Remove the radiator securing brackets from each side.

Refitting

9. Check that the radiator sealing strips are securely located.
10. Transfer the oil cooler adaptors if fitting a new radiator.
11. Reverse the removal procedure, ensuring that oil cooler connections are tightened to the specified torque values before fitting the fan blades and cowl.
11. Clean any coolant/oil spillage from the vehicle.
12. Check all connections for coolant/oil leaks.
Continued
EXPANSION TANK

Remove and refit

Removing

**WARNING:** Do not remove the expansion tank filler cap when the engine is hot, because the cooling system is pressurised and personal scalding could result.

1. Remove the expansion tank filler cap by first turning it counter-clockwise a quarter of a turn to allow pressure to escape, turn it further in the same direction and lift off.
2. Disconnect the radiator hose from the bottom of the expansion tank, allowing the coolant to drain into a suitable container.
3. Disconnect the bleed hose to the top of the radiator.
4. Disconnect the wiring to the coolant sensor.
5. Remove the bolt from the securing strap.
6. Lift out the expansion tank.

Refitting

7. Reverse removal instructions.
8. Replenish the cooling system.
9. Check for leaks around all hose connections.
COOLING SYSTEM • 1990 model year

The cooling system is improved by the introduction of a larger, plastic expansion tank.

COOLANT

Drain and refill

Draining

WARNING: Do not remove the expansion tank filler cap when the engine is hot, because the cooling system is pressurised and personal scalding could result.

NOTE: The expansion tank is fitted with a screwed filler cap which incorporates a low coolant sensing unit.

1. Remove the expansion tank filler cap by slowly turning it anti-clockwise, pause to allow pressure to escape, continue turning it in the same direction and lift off.

2. Remove the radiator filler plug and 'O' ring to assist drainage.

3. Disconnect the bottom hose at its junction with the radiator and allow the coolant to drain into a suitable container. Ensure that the container is clean if the coolant solution is to be re-used. Reconnect the bottom hose after draining and re-tighten the hose clamp.

4. Remove the engine drain plugs, one each side of the cylinder block, beneath the exhaust manifolds. Allow the coolant to drain, refit and tighten the plugs.
NOTE: It is not possible to drain all the coolant retained in the heater system. Flush through the system, after draining, by pouring clean water into the fill tower, see RR2659E, with the bottom hose disconnected and engine drain plugs removed.

5. Pour the correct solution of water and anti-freeze into the expansion tank until the radiator is full.
6. Start the engine and run it until normal operating temperature is attained, topping up as necessary.
7. Refit the radiator filler plug and 'O' ring, fitting a new 'O' ring it required. Tighten to the correct torque, see Torque Values, section 06.
8. Fit the expansion tank filler cap.
9. Allow the engine to cool, check coolant level and top up the expansion tank until the level reaches the seam of the expansion tank.

CAUTION: The following fill procedure MUST be followed if the heater pipes mounted on top of the rocker cover have been removed for any reason.

10. Remove the plug from the fill tower.
11. Briskly pour the correct solution of water and anti-freeze into the fill tower until the radiator is full.

12. Start the engine and run it until normal operating temperature is attained, topping up as necessary.
13. Refit the radiator filler plug and fill tower plug, fitting new 'O' rings if required. Tighten to the correct torque, see Torque Values, section 06.
14. Fit the expansion tank filler cap.
15. Allow the engine to cool, check coolant level in the expansion tank and top up until the level reaches the seam of the expansion tank.

EXPANSION TANK
Remove and refit

WARNING: Do not remove the expansion tank filler cap when the engine is hot, because the cooling system is pressurised and personal scalding could result.

1. Remove the expansion tank filler cap by first turning it slowly anti-clockwise, pause to allow pressure to escape, continue turning it in the same direction and lift off.
2. Disconnect the two hoses from the bottom of the expansion tank, allowing the coolant to drain into a suitable container.
3. Remove three fixing bolts and remove the expansion tank from its mountings.

4. Reverse removal instructions.
5. Replenish the cooling system.
6. Check for leaks around all hose connections.
